No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

     This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 st SBS (deposited as ATCC VR-2546), is designated Contig ID 14, and es a HSV-2 protein. The protein can be used for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2088 BP; 417 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence encodes a truncated form of the HSVgB polypeptide. The recombinant protein can be used to prepare vaccines for prophylaxis of HSV infection and for use in diagnostic kits. See also AAQ14478.

                                                                                                                                                                      corresponding to that occurring in glycoprotein B of HSV-1 or HSV-2 virus which is antigenic to HSV-1 of HSV-2, which contains no more than 750 AA residues, and which includes AA residues 135-649 inclusive is claimed. It can be used to produce vaccines for prophylaxis and treatment of HSV-1 and HSV-2. See AAN71399 for the HSV-2 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   prevention of disease, to induce an immunological response in to identify inhibitors, activators or novel antivirals. Antago the proteins can be used to inhibit a viral polypeptide. The D or a vector containing it can also be used to induce an immuno response in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant and 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         glycoprotein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

The inventors claim a non-glycosylated amino acid chain comprising a sequence corresponding to that occurring in glycoprotein B of HSV-1 or HSV-2. Preferably, when the chain comprises a sequence corresp. to that occurring in glycoprotein B of HSV-2, it contains 4-750 AA residues. The chain esp.has a molecular wt. of 65000 daltons and includes AA residues 165-629 from the HSV-2 glycoprotein B sequence.
                                                                                                                                                                                                                             New amino acid chains of glyco-protein B of herpes simplex virus - prepd. by recombination DNA methods for use in vaccines

This sequence was isolated from HSV-2 strain SBS (deposited as ATCC VR-2546), is designated Contig ID 91, and encodes a HSV-2 protein. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

This fusion protein shows the same physiological activity as surface antigen prepd. from HSV infected cells. It can be used in a vaccine for the prevention of HSV infection.
                                                                   Virus infections. The vaccine is mafe in use carcinogenic gene, as with prior vaccines. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                     The gene encodes a gB glycoprotein which is useful for the production of vaccines conferring protection against herpes simplex virus infections. The vaccine is safe in use and does not contain a
                                                                                                                                                                      Recombinant DNA containing herpes simplex virus gene or fragment useful in transformant yeast for prodn. of high purity herpes simplex virus glycoproteins for use in protective vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-MAR-2003

                                                                                                                                                                                         The gene encoding HSV gB is cloned into E.coli. To increase the efficiency of expression, the gene encoding the C-terminal region of gB, which is very hydrophobic, is removed and the remaining gene is cloned into an expression vector. The vector is composed of pBR322, SV40 early promoter and the HSV gB gene.

The construct is useful for the production of a good antigen for a HSV vaccine.

The recombinant profession esp. truncated forms of it, can be used to prepare vaccines prophylaxis of HSV infection and for use in diagnostic kits. See also AAQ14479.

                                                                                                                                                                                                                                                                                                                                            The present sequence is from the Herpes simplex virus (HSV) type I strain Patton and encodes a glycoprotein B. HSV is a double stranded virus packaged within an icosohedral nucleocapsid enveloped within a membrane. The membrane includes a number of virus-specific glycoproteins, with glycoprotein B being one of the most abundant. Glycoprotein B from both HSV type I and type II are cross reactive. New vaccines comprising recombinantly produced glycosylated glycoprotein B that has a deletion of at least part of the transmembrane anchor region, in combination with a carrier and an adjuvant have been produced. The vaccines are used for immunising humans against HSV (HSV type 1) by vaccination before or after primary infection with HSV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sg

The amino acid sequence and DNA sequence for gB 1 presented in RAP80914 and AAN80907 differ from that originally presented in Table 1 of International Publication No. WO 85/04587. The DNA sequence in Table 1 contains an error in that an additional nucleocide (G) is listed at position 607 which resulted in a shift in reading frame relative to AAN80907 from which this nucleotide has been deleted.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is from the Herpes simplex virus (HSV) type 2 strain 33 and encodes a glycoprotein B. HSV is a double strained virus packaged within an icosohedral nucleocapsid enveloped within a membrane. The membrane includes a number of virus-specific glycoproteins, with glycoprotein B being one of the most abundant. Glycoprotein B trom both HSV type I and type II are cross reactive. New vaccines comprising recombinantly produced glycosylated glycoprotein B that has a deletion of at least part of the transmembrane anchor region, in combination with a carrier and an adjuvant have been produced. The vaccines are used for immunising humans against HSV (HSV type 1 or HSV type 2) by vaccination before or after primary infection with HSV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig 4A-F; 33pp; English.

GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: ANUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ANUGUENCES FOR DIAGNOSTICS AND THERAPEUTICS
FILE, REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-18
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 828
LENGTH: 2577
TYPE: DNA
ORGANISM: Pseudomonas aeruginosa

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788

Sequence 3140, Application US/09938842A

Patent No. US20020160378A1

Patent No. US20020160378A

PAPPLICANT: Wang, Xun

APPLICANT: Wang, Xun

APPLICANT: Wang, Xun

APPLICANT: Wang, Xun

APPLICANT: Wang, Xun

PATENCOF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING

TITLE OF INVENTION: SAME, AND METHODS OF USE

PILE REFERENCE: SCRIP1300-3

CURRENT PAPLICATION NUMBER: US 60/29/938,842A

CURRENT PAPLICATION NUMBER: US 60/227,866

PRIOR APPLICATION NUMBER: US 60/227,866

PRIOR APPLICATION NUMBER: US 60/264,647

PRIOR PILLING DATE: 2001-08-24

PRIOR APPLICATION NUMBER: US 60/264,647

PRIOR PILLING DATE: 2001-06-22

NUMBER OF SEQ ID NOS: 5379

SEQ ID NO 3140

LENGTH: 1691

TYPE: DNA

ORGANISM: Arabidopsis thaliana

DNA is from a doubled haploid provided by Tom Osborn.
Seq primer: TF
Class: sheared ends.
                                                                                                                                                  Brassica oleracea

Bukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;

Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; rosids
; eurosids II; Brassicales; Brassicaceae; Brassica.

1 (bases 1 to 794)

Town, C.D., Van Aken, S., Utterback, T., Koo, H. and Fraser, C.M.

Whole genome shotgun sequencing of Brassica oleracea
Unpublished

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01612008930
                                                                                                                                                                                                                                                                                                /note=Worgan: kidney + adrenal; Vector: pBluescript II
KS(+), Site 1: EcoRI; Site 2: Not1; This normalized
library was constructed from 1 million independent clones.
cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not1 adapters, digested with EcoRI
, size-selected, and cloned into the Not1 and EcoRI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1995; 791, except that a significantly longer
reannealing hybridization was used."
